# Reading, inspecting, and cleaning data from CSV

IMPORTING AND MANAGING FINANCIAL DATA IN PYTHON

Stefan Jansen Instructor

#### Import and clean data

- Ensure that pd.DataFrame() is same as CSV source file
- Stock exchange listings: amex-listings.csv

	Α	B	С	D	E	F	G	Н
1	Stock Symbo	Company Name	Last Sale	Market Capitalization	IPO Year	Sector	Industry	Last Update
2	XXII	22nd Century Group, Inc	1.33	120628490.3	n/a	Consumer N	Farming/See	4/24/17
3	FAX	Aberdeen Asia-Pacific Income Fund Inc	5	1266332595	1986	n/a	n/a	4/24/17
4	IAF	Aberdeen Australia Equity Fund Inc	6.15	139865304.9	n/a	n/a	n/a	4/24/17

#### How pandas stores data

- Each column has its own data format ( dtype )
- dtype affects your calculation and visualization

pandas dtype Column characteristics						
object	Text, or a mix of text and numeric data					
int64	Numeric: whole numbers - 64 bits ( $\leq 2^{64}$ )					
float64	Numeric: Decimals, or whole numbers with missing values					
datetime64	Date and time information					

#### Import & inspect

```
import pandas as pd
amex = pd.read_csv('amex-listings.csv')
amex.info() # To inspect table structure & data types
```

```
RangeIndex: 360 entries, 0 to 359
Data columns (total 8 columns):
Stock Symbol 360 non-null object
Company Name
                    360 non-null object
        360 non-null object
Last Sale
Market Capitalization 360 non-null float64
IPO Year
                     360 non-null object
                     360 non-null object
Sector
Industry
                     360 non-null object
Last Update
                    360 non-null object
dtypes: float64(1), object(7)
```

#### Dealing with missing values

```
# Replace 'n/a' with np.nan
amex = pd.read_csv('amex-listings.csv', na_values='n/a')
amex.info()
```

```
RangeIndex: 360 entries, 0 to 359
Data columns (total 8 columns):
Stock Symbol 360 non-null object
Company Name 360 non-null object
Last Sale
          346 non-null float64
Market Capitalization 360 non-null float64
        105 non-null float64
IPO Year
                     238 non-null object
Sector
Industry
                     238 non-null object
Last Update
                     360 non-null object
dtypes: float64(3), object(5)
```

#### Properly parsing dates

```
RangeIndex: 360 entries, 0 to 359
Data columns (total 8 columns):
Stock Symbol
                      360 non-null object
Company Name
                      360 non-null object
Last Sale
          346 non-null float64
Market Capitalization
                      360 non-null float64
IPO Year
                      105 non-null float64
Sector
                      238 non-null object
                      238 non-null object
Industry
Last Update
                      360 non-null datetime64[ns]
dtypes: datetime64[ns](1) float64(3), object(4)
```

#### Showing off the result

```
amex.head(2) # Show first n rows (default: 5)
```

```
Stock Symbol
              Company Name
       XXII
              22nd Century Group, Inc

7	FCO	Aberdeen Global Incom	8.62	75376107.36	1992	n/a	n/a	
	amex nasdaq nyse +							

- pd.read\_excel(file, sheetname=0)
  - Select first sheet by default with sheetname=0
  - Select by name with sheetname='amex'
  - Import several sheets with list such as sheetname=['amex', 'nasdaq']

#### Import data from one sheet

```
RangeIndex: 360 entries, 0 to 359

Data columns (total 8 columns):

Stock Symbol 360 non-null object

Company Name 360 non-null float64

Market Capitalization 360 non-null float64

IPO Year 105 non-null float64

...
```

#### Import data from two sheets

```
RangeIndex: 3167 entries, 0 to 3166

Data columns (total 7 columns):

Stock Symbol 3167 non-null object

Company Name 3167 non-null object

Last Sale 3165 non-null float64

Market Capitalization 3167 non-null float64

IPO Year 1386 non-null float64

...
```

#### Get sheet names

```
xls = pd.ExcelFile('listings.xlsx') # pd.ExcelFile object
exchanges = xls.sheet_names
exchanges
```

```
['amex', 'nasdaq', 'nyse']
```

#### Get sheet names

nyse.info()

```
RangeIndex: 3147 entries, 0 to 3146

Data columns (total 7 columns):

Stock Symbol 3147 non-null object

Company Name 3147 non-null object

... ...

Industry 2177 non-null object

dtypes: float64(3), object(4)

memory usage: 172.2+ KB
```

IMPORTING AND MANAGING FINANCIAL DATA IN PYTHON

# Combine data from multiple worksheets

IMPORTING AND MANAGING FINANCIAL DATA IN PYTHON

Stefan Jansen Instructor

#### **Combine DataFrames**

- Concatenate or "stack" a list of pd.DataFrame s
- Syntax: pd.concat([amex, nasdaq, nyse])

	NA	ASD	AQ	Syml	ool	Name	•		Last	Sale
		0		GOC	)G	Googl	е		623	.21
	NYS	SE	Syn	nbol	Na	me			Last Sa	le
	0		JF	PM	J	Р			84.40	
ļ	AMEX	S	ymb	1 lo	lam	е		La	st Sale	
	0		BTI	Е	3ritis	h		(	67.24	
	1		IMO							
	2									

#### **Combine DataFrames**

- Concatenate or "stack" a list of pd.DataFrame s
- Syntax: pd.concat([amex, nasdaq, nyse])

		NAS	DAQ	Syml	ool Na	ame		Last	Sale		
			0	GOC	G Gc	ogle		623	.21		
	N	IYSE	Syı	nbol	Name	e		Last Sa	le		
		0	JI	PM	JP			84.40		2	)
A	λM	EX	Symb	1 loc	lame		L	ast Sale			<b>\)</b> .
	C	)	ВТ	l E	British			67.24			ጎ l
	1		IMC	)							5
	2	2									
										V	

#### **Combine DataFrames**

- Concatenate or "stack" a list of pd.DataFrame s
- Syntax: pd.concat([amex, nasdaq, nyse])

NAS	SDAQ	Symbo	ol Nam	ne .	Las	t Sale
	0	G000	G Goog	gle	62	23.21
NYS	E Syı	nbol	Name		Last S	Sale
0	J	PM	JP		84.4	10
AMEX	Syml	ool Na	ame		Last Sal	е
0	ВТ	l Br	ritish		67.24	
1	IMC	)				
2						

#### Matches on column names

Exchanges	Symbol	Name	 Last Sale
0	GOOG	Google	 623.21
1			 
2			 
3			 
0	JPM	JP	84.40
1			 
2			 
3			 
0	BTI	British	67.24
4			

#### Concatenate two DataFrames

```
Int64Index: 3507 entries, 0 to 3146
Stock Symbol 3507 non-null object
...
```

#### Add a reference column

```
amex['Exchange'] = 'AMEX' # Add column to reference source
nyse['Exchange'] = 'NYSE'
listings = pd.concat([amex, nyse])
listings.head(2)
```

```
Stock Symbol ... Exchange

0 XXII ... AMEX

1 FAX ... AMEX
```

#### **Combine three DataFrames**

```
xls = pd.ExcelFile('listings.xlsx')
exchanges = xls.sheet_names
# Create empty list to collect DataFrames
listings = []
for exchange in exchanges:
  listing = pd.read_excel(xls, sheetname=exchange)
  # Add reference col
  listing['Exchange'] = exchanges
  # Add DataFrame to list
  listings.append(listing)
# List of DataFrames
combined_listings = pd.concat(listings)
```

#### **Combine three DataFrames**

combined\_listings.info()

```
Int64Index: 6674 entries, 0 to 359
Data columns (total 8 columns):
Stock Symbol
                       6674 non-null object
Company Name
                       6674 non-null object
            6590 non-null float64
Last Sale
Market Capitalization 6674 non-null float64
              2852 non-null float64
IPO Year
                       5182 non-null object
Sector
Industry
                       5182 non-null object
